Template Manual

Bacchus HTML

Thank You :)

Thanks for purchasing template and for supporting our work. Bacchus is our new fancy template. Responsive, clean and professional look with sleek design will satisfy all your needs. All parts are nested in divs which representing each menu item section.

You will need basic HTML, CSS, jQuery skills to edit Bacchus HTML. We will try to help you out with this documentation. If we fail here, you can always contact us on cocobasicthemes@gmail.com and our developers will try to solve your issue.

HTML Structure

Bacchus consist one major HTML file **index.html** where are several sections included and **single.html** file.

- index.html - Big front page
- single.html - Single post file

Big front page (Index.html) consist of several sections (Home, Services, Portfolio, News, Support, Focus, Pricing, Team and Contact). Each section is separated and start with code like this:

```html
<!-- Service -->
<div id="services" class="section">

. . .

</div>

<!-- Portfolio -->
<div id="portfolio" class="section">

. . .

</div>
```

Home section

On Home section you will find code like this (slider code):

```
<script>
   var slider1_speed = "2000";
   var slider1_auto = "true";
   var slider1_hover = "false";
 </script>

 <div class="image-slider-wrapper relative">
            <div id="slider1" class="image-slider slider">
               <div>
           <img src="images/hero_img_01.jpg" alt="">
                 </div>
                 <div>
           <img src="images/hero_img_02.jpg" alt="">
         </div>
                 <div>
                   <img src="images/hero_img_03.jpg" alt="">
         </div>
      </div>
    </div>
```

If you need one more slider, duplicate that code and change "**slider1**" string on several places with new string, for example "**slider2**". So you will have "**slider2_speed**", "**slider2_auto**", id="**slider2**"...

Portfolio Items

Code for Portfolio item looks like this:

```
<div class="grid-item element-item p_1x1">
 <a data-rel="prettyPhoto[gallery1]" href="images/portfolio_item_02_large.jpg">
    <img src="images/portfolio_item_02.jpg" alt="">
    <div class="portfolio-text-holder">
        <div class="portfolio-text-wrapper">
            <p class="portfolio-type">
                <img src="images/icon_view@2x.png" alt="">
            </p>
            <p class="portfolio-text">IMAGE</p>
        </div>
    </div>
 </a>
</div>
```

In first line, important class is "**p_1x1**" - this mean, the item will be 1/3 of portfolio width (on our demo it is smaller image, "**width: 390px**") . If you want to have bigger item in row (2/3 of portfolio width, "**width: 780px**"), you need to use "**p_2x2**" class (first item on demo site is big item, all others are smaller).

Focus section

On Focus section you will find code like this (slider code):

```html
<script>
        var text1_speed = "500";
        var text1_auto = "false";
        var text1_hover = "true";
</script>
  <div class="testimonial-slider-holder relative">
    <div class="testimonial-slider-quote">"</div>
      <div id="text1" class="testimonial-slider slider">
        <div>
          <div class="testimonial-content">
            <p class="author-text">
            The difference between a Designer and Developer, when it comes to design skills, is the
difference between shooting a bullet and throwing it.
            </p>
            <img class="author-img" src="images/avatar_img_01@2x.png" alt=""/>
            <p class="author-name">Jane Williams</p>
          </div>
        </div>
        <div>
          <div class="testimonial-content">
            <p class="author-text">
            The difference between a Designer and Developer, when it comes to design skills, is the
difference between shooting a bullet and throwing it.
            </p>
            <img class="author-img" src="images/avatar_img_01@2x.png" alt=""/>
            <p class="author-name">Jane Williams</p>
          </div>
        </div>
      </div>
    </div>
```

If you need one more slider, duplicate that code and change "**text1**" string on several places with new string, for example "**text2**". So you will have "**text2_speed**", "**text2_auto**", id="**text2**"..

Mail Configuration

Note: Do not remove any quote or double quote signs while doing this.

One notice: this will be functional only on your server, php file can not be executed on your local computer.

Just add your own email address here in your config.php file.

```
//SITE GLOBAL CONFIGURATION
$email = "your@email.here"; //<-- Your email
```

Element Animation

On Bacchus are several elements which have fadeIn animation when the element comes in viewport. To add element animation, all you need to do is to add class "**animate**". For example:

```
<div class="pricing-holder price1 animate">
    <p class="pricing-title">
        ...
```

Also, there are 3 classes which allows you to set 0.3s - 0.9s animation delay ("**wait-03s**", "**wait-06s**", "**wait-09s**"). Use it like this:

```
<div class="pricing-holder price1 animate wait-03s">
    <p class="pricing-title">
        ...
```

Source & Credits

Special thanks to creators and contributors of these awesome libraries (photos, vectors, js, psd's, etc...), we couldn't done this without them
(we are sorry if we forgot to mention someone).
